

BR 14p - Type PSA · High-Performance Control and Shut-off Butterfly valve DIN- and ANSI-Version

Applications

Tight-closing control and shut-off butterfly valve for use in the pressure swing adsorption process:

- **Nominal size DN 80 to 400 and NPS3 to 16**
- **Nominal pressure PN 10 to 40 and cl150 and cl300**
- **Temperatures -20 °C to +180 °C (-4 °F to 356 °F)**

Pressure swing adsorption (PSA) is a method used to separate a gas from a gas mixture as well as to dry or clean gases.

The purity and quantity of the gas to be extracted strongly depends on the control valves used in this process.

The control valves used in PSA applications must shut-off tightly, have short opening and closing times as well as a high level of operational reliability.

The bidirectional high-performance butterfly valve has the following properties:

- Body in steel (A216 WCB/1.0619)
(A352 LCC / 1.6220)
- Body in stainless steel (A351 CF8M/1.4408)
- Lug-type or wafer-type
- Face-to-face dimension in standard version acc. to DIN EN 558 R16 and API 609. Special face-to-face dimensions are available
- Soft seal (PSA Version)
- Operating temperature from -20 °C to +180 °C (-4°F to +356 °F)
- Gas tight on both sides
- TA-Luft (German clean air act) packing
- Attachment options acc. to DIN ISO 5211

Table 1: Parts list

Item	Description	Item	Description	Item	Description
1	Valve body	11	Bearing bush	21	O-ring
2	Control shaft	12	Distance bush	22	O-ring
3	Shaft head	13	Disc spring set	23	Ring
4	Valve disc	14	Seat ring	24	Screw
5	Valve disc ring	15	V-ring packing	25	Screw
6	Intermediate flange	16	Disc	26	Screw
7	Cover	17	Disc	27	Screw
8	Stuffing box flange	18	Disc	28	Straight pin
9	Fastening ring	19	Ring	29	Screw
10	Bearing bush	20	O-ring		

Principle of operation

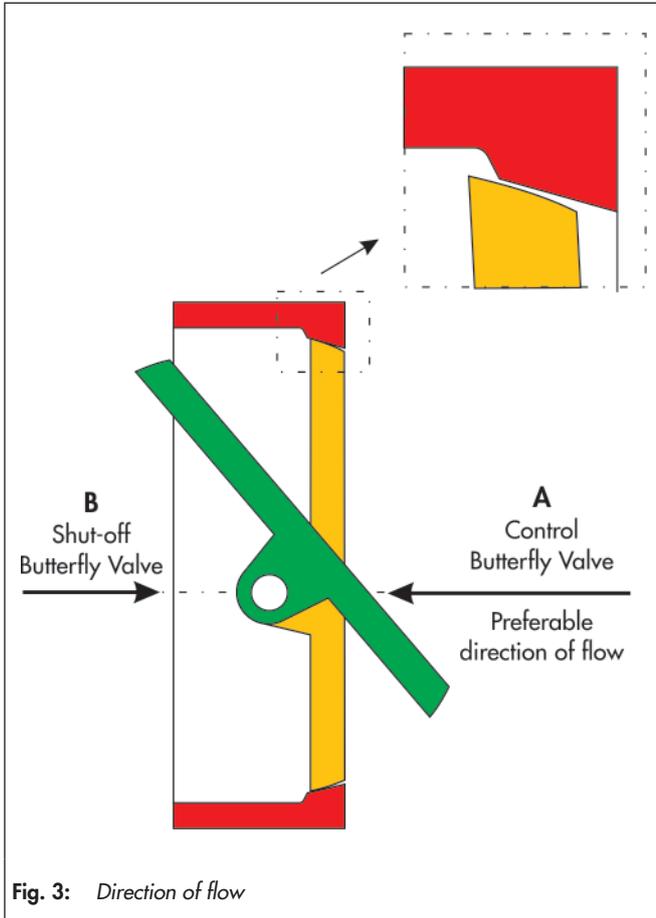

Fig. 3: Direction of flow

The process medium can flow through the valve in both directions.

The valve disc (4) determines the flow through the free area between disc and seat ring (14).

Butterfly valves are sealed between the valve disc (4) and the seat ring (14).

The control shaft (2) is sealed by a packing (15).

The standard packing is a maintenance-free PTFE V-ring packing which is loaded by disc spring set (13).

Optionally, a graphite Inconel-packing can be used which is also loaded by disc spring sets (13).

The direction of flow and the differential pressure determine the breakaway torque to open the butterfly valve.

The double-eccentric bearing design of the control shaft causes the valve disc on opening and closing to remain in contact with the seat ring only over a very small angle of rotation (Fig. 4).

This reduces wear and increases the service life of the valve.

In addition, it reduces the breakaway torque.

When the process medium flows through the valve in direction A (Fig. 3), the valve disc is slightly pressed out of the seat ring.

This reduces the pre-load force and the breakaway torque.

When the process medium flows through the valve in direction B, the pre-load force increases as the breakaway torque rises.

Fail-safe position

Depending on how the actuator is mounted, there are two fail-safe positions, which become active when the pressure is relieved and upon failure of air supply:

- **Butterfly valve with fail-close actuator**

Upon failure of the air supply, the butterfly valve closes. The valve opens as the signal pressure increases, opposing the force of the springs.

- **Butterfly valve with fail-open actuator**

Upon failure of the air supply, the butterfly valve opens. The valve closes as the signal pressure increases, opposing the force of the springs.

i Info

These valves are not subject to ATEX 2014/34/EU.

Selecting and sizing the butterfly valve

1. Calculate the appropriate KV coefficient.
2. Select the nominal size and KVS coefficient from Table 6.
3. Check the operation conditions taking the pressure-temperature diagram into account.
4. Select a suitable actuator.
