

#### Application

Electric actuator for industrial applications

#### Special features

The electric actuator is suitable for mounting on Series 240, 250 and 280 Valves with 15 to 120 mm travel. The following limit switches and signaling components are included in the actuator:

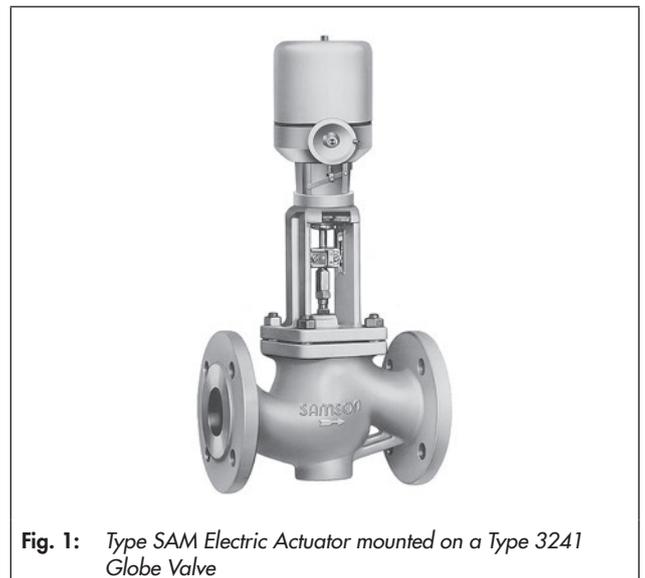

- Two torque-dependent changeover switches
- Three travel-dependent changeover switches
- Anti-rotation fixture

#### Versions

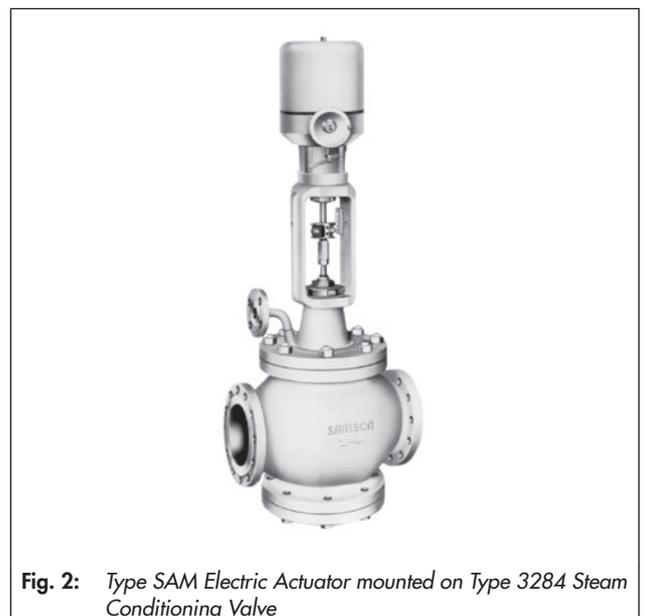

- Three-step version
- Version with positioner
- Single-phase or multi-phase operation
- Operation with DC voltage
- Standard version with surface-cooled squirrel-cage motor

#### Options

- Electronic positioner with input and output signals 0/4 to 20 mA or 0 to 10 V
- Electronic position transmitter with an output signal from 0/4 to 20 mA
- One or two resistance transmitters 100, 200, 1000 or 2000  $\Omega$
- Additional travel-dependent changeover switch
- Temperature monitor (depending on actuator model)
- Heating for the terminal compartment
- Integrated reversing contactor for multi-phase operation

**Fig. 1:** Type SAM Electric Actuator mounted on a Type 3241 Globe Valve

**Fig. 2:** Type SAM Electric Actuator mounted on Type 3284 Steam Conditioning Valve

## Design and principle of operation

The actuator motor converts the output pulses of the three-step controller into steps of travel. The length of these steps and the direction of rotation depend on the amount and the sign of the control deviation.

The rotary motion of the motor is transferred to the gear wheel by the gearing; the gear wheel is shrunk on a bushing with female thread. The top section of the actuator stem which is provided with the matching male thread engages the female thread. Due to the rotary motion of the gear wheel and bushing, the actuator stem screws into the female thread and performs a lifting, linear motion. The actuator stem can be moved manually after decoupling the motor.

The electrical components are housed beneath the sealed actuator cover in a compartment where they are separated from the gearing. They are protected against dust in this compartment and can be easily accessed after lifting off the actuator cover.

### - Switch

All versions are equipped with two torque switches (S1 and S2 in Fig. 4) switch off the motor when the adjusted force is reached, e.g. when the valve plug rests against the seat or when the linear motion is obstructed in any way.

The three floating travel switches (S3 to S5 in Fig. 4) can be continuously adjusted. They issue a limit signal when the adjusted limit values are exceeded.

The switch (S3) functions as a NC contact and is used to limit the travel in retracting direction. The actuator is switched off when the adjusted travel limit is reached.

The switches (S4 and S5) can be used to indicate the actuator stem position or when the adjusted travel is reached.

The travel switch S3 must be adjusted in such a way that the valve travel is restricted in the retracting direction by switching off the motor.

### - Resistance transmitters

The resistance transmitters are linked to the motor gear and produces a resistance signal, which is proportional to the valve travel.

### - Position transmitter (ESR)

The position transmitter is a 0/4 to 20 mA signal, which is proportional to the travel.

## Mounting

The actuator can be combined with the Series 240, 250 and 280 Valves (form A). It is fastened to the valve bonnet with a ring nut. The actuator and plug stems are fastened together by a stem connector.

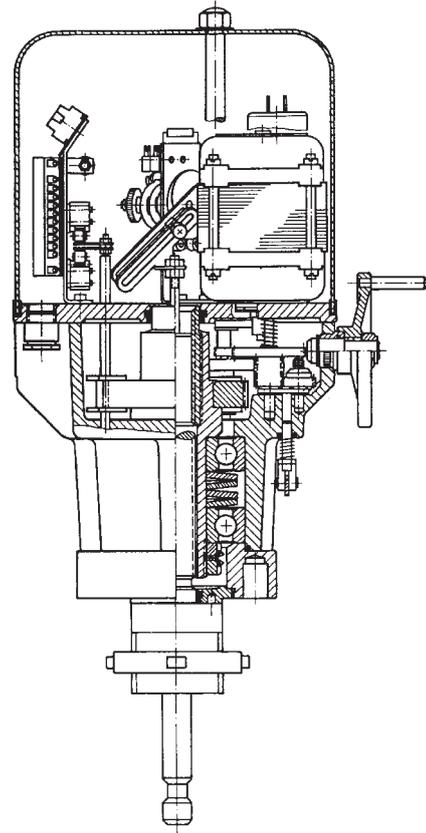

Fig. 3: Type SAM Electric Actuator

## Electrical connection

Either the internal terminal block (standard version) or the 32-pole terminal block in the terminal box can be used to connect the actuator.

### **i** Note

The wiring plan is stuck in the actuator cover.

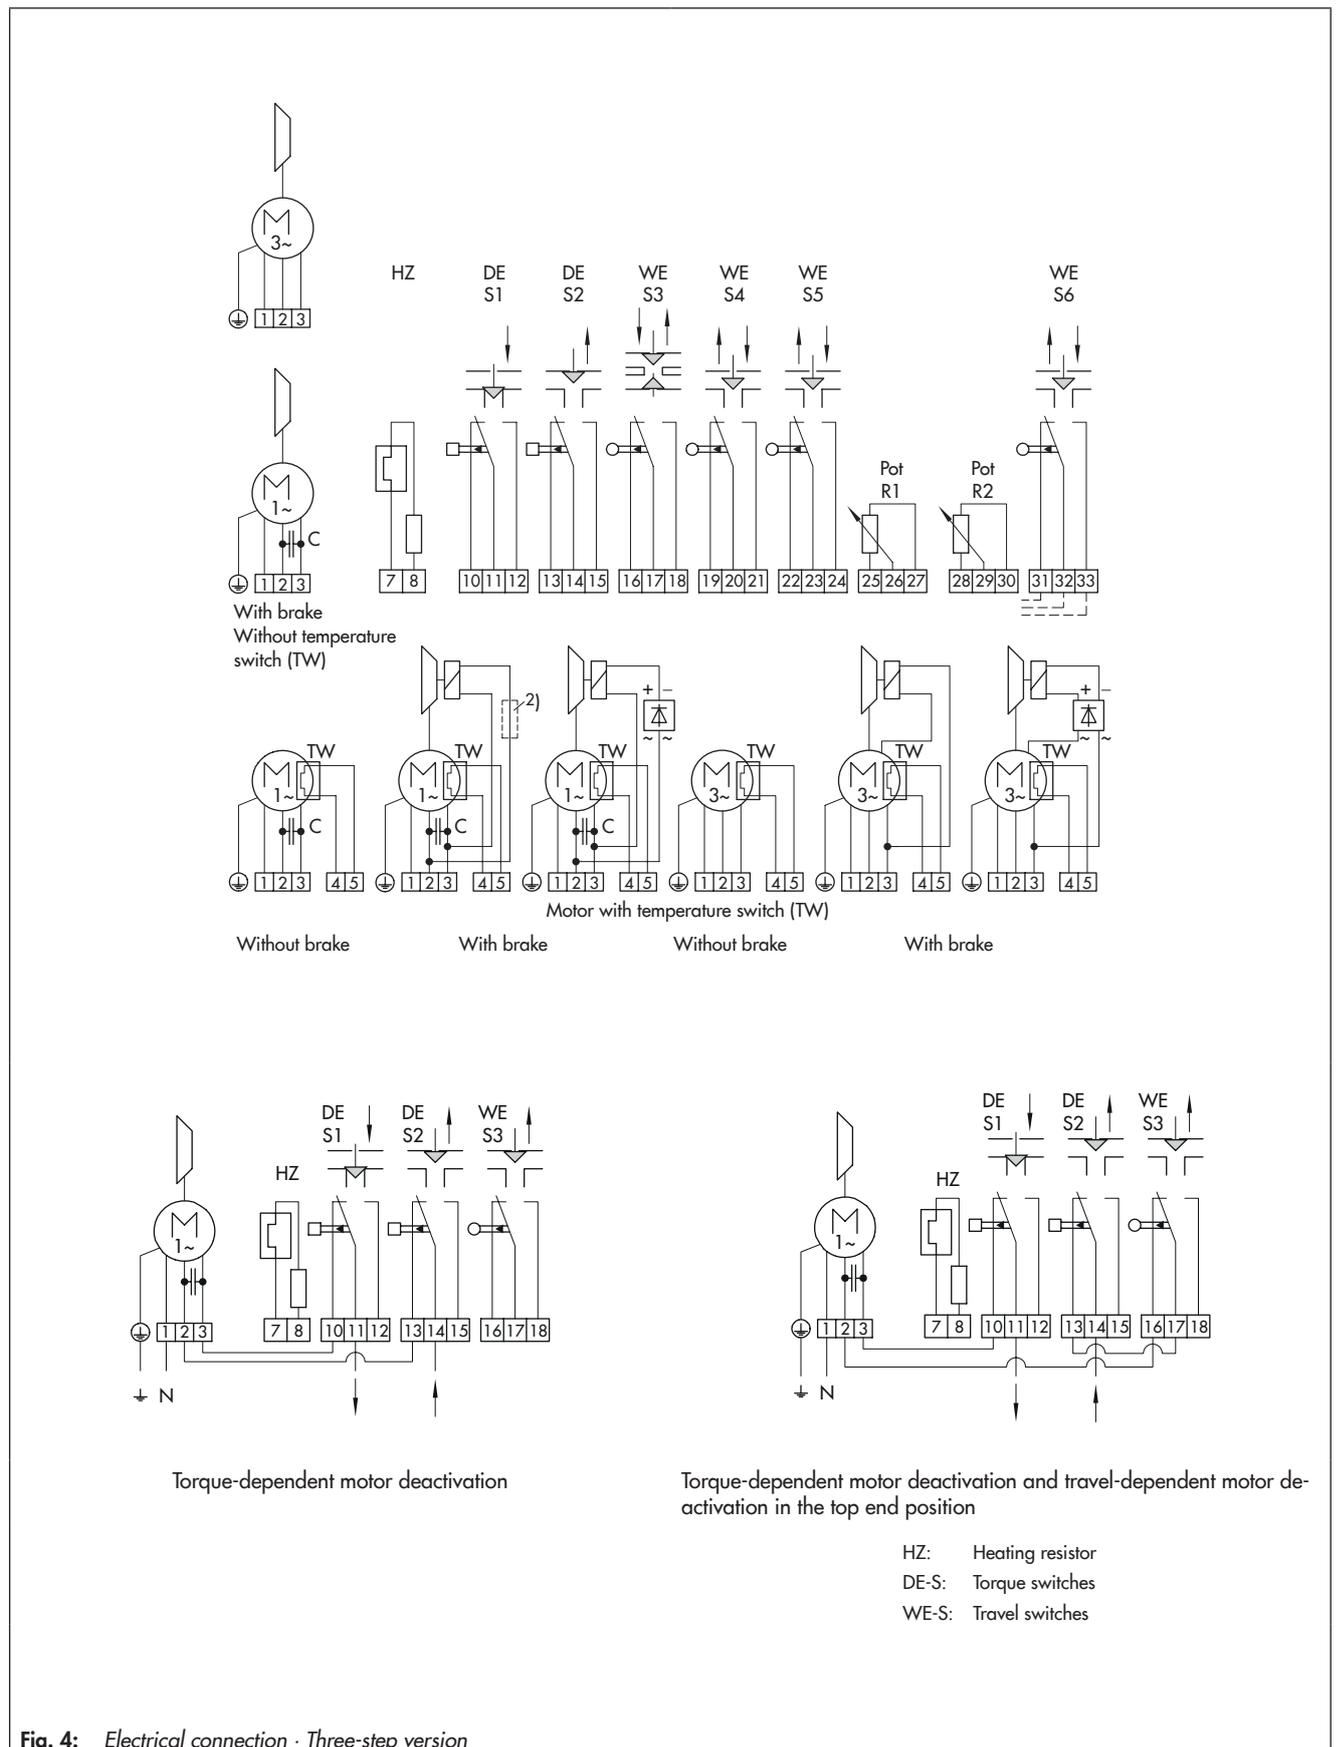

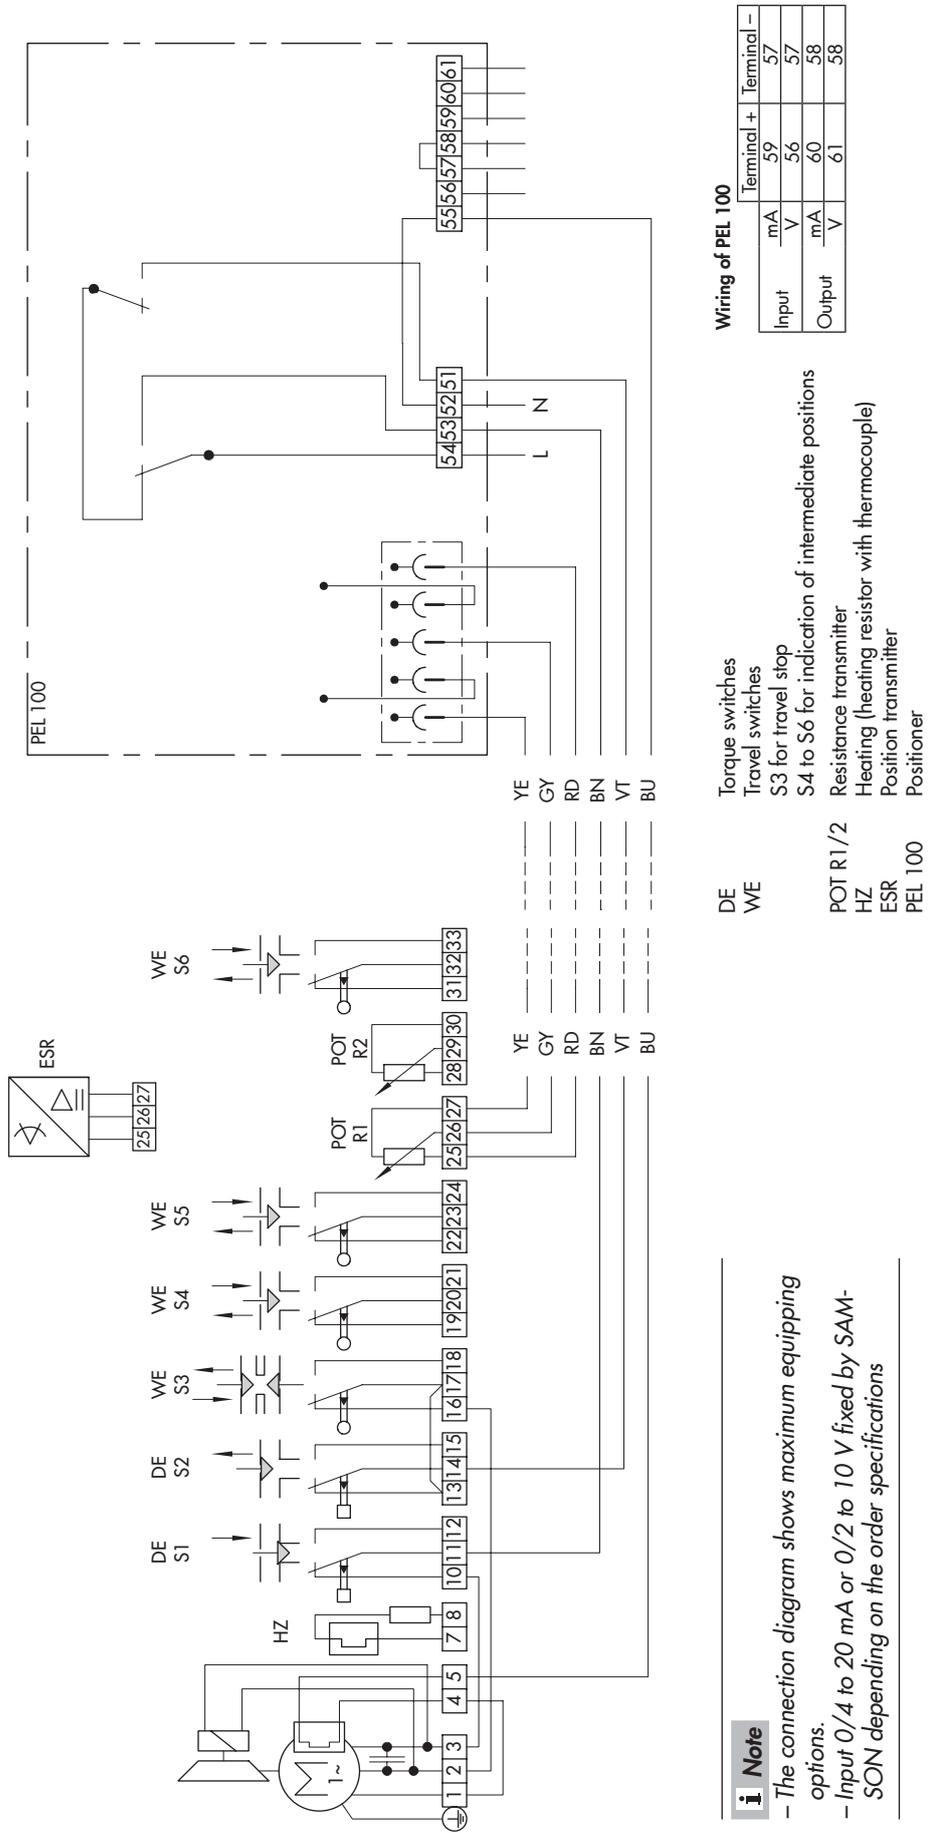

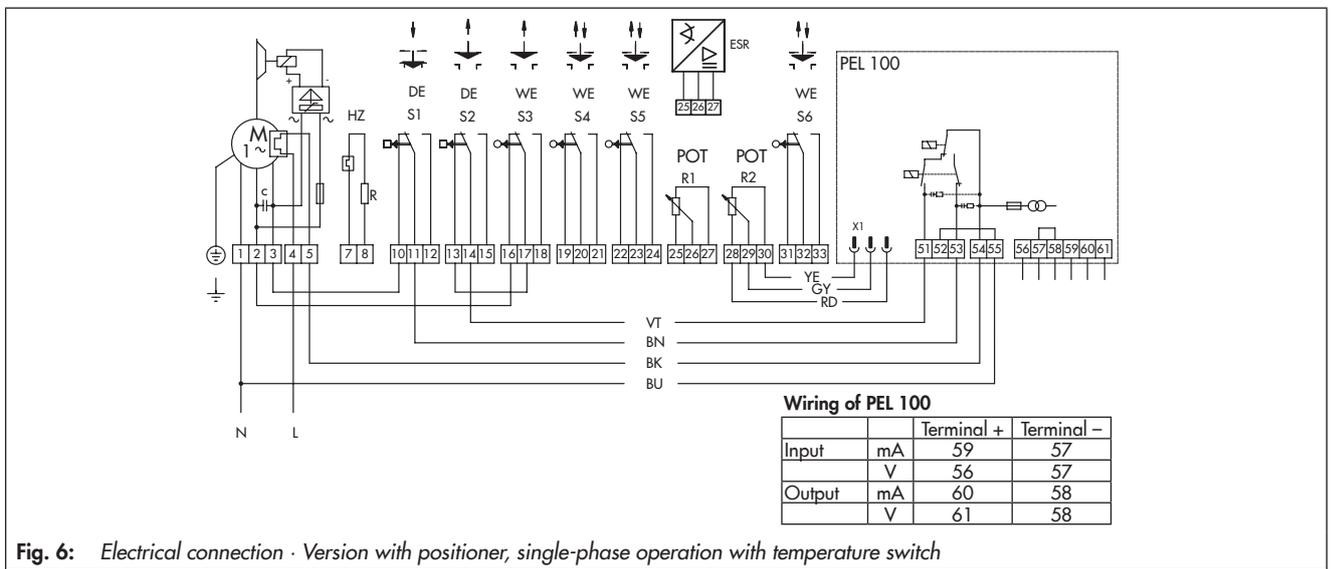

Fig. 4: Electrical connection · Three-step version

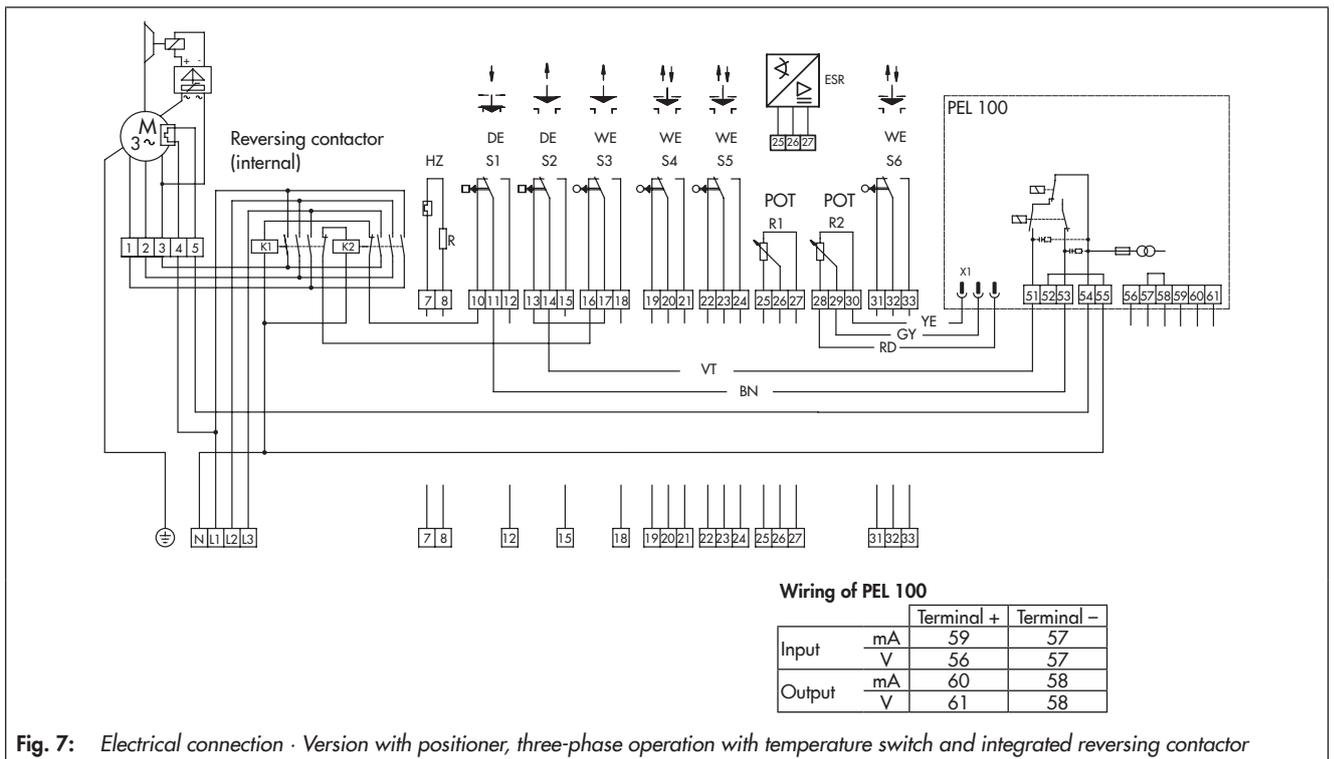

**Note**  
 - The connection diagram shows maximum equipping options.  
 - Input 0/4 to 20 mA or 0/2 to 10 V fixed by SAM-SON depending on the order specifications
